# **Bourgault Aircarts**

Part Kit #VARIES - Rev 2.0 - AIRGUARD - Blockage Prevention System

Release Date: 2024-03-28

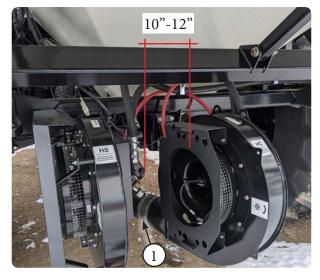

| Title | Airguard Blockage Prevention System Upgrade Instructions  | RELEASE DATE | 2024-03-28 |
|-------|---|--------------|------------|
| STEP  | 1. For installations on both fans with rear hitch, the fan will need to be shifted over for   | 1            | 2.0        |
|       | sufficient room to install the BP System. Disconnect flexible outlet hose (Item 1) from the fan outlet on fan #1 and/or fan #2. Loosen the U-Bolts / Bolts (Item 2) that hold | PART KIT #   | Varies     |
|       | the fan mount bracket to the axle. In some cases the U-Bolts / Bolts may need to be   |              |            |
|       | removed completely and reinstalled in the new location. Allow for 10-12" of space be-   |              |            |
|       | tween the fan motor and the intake screen of the neighboring fan. A 7" flexible hose extension kit (Item 4) will be required when moving fan over. Hose may need to be        |              |            |
|       | trimmed to reduce kinking. See pages 3-6 for specific relocation bracket installation   |              |            |
|       | inscructions. If installation is only on the outside fan, remove deflector shield (Item   |              |            |
|       | 3) and skip to page 8.  |              |            |

MODEL SPECIFIC CONNECTION WHEN INSTALLING ON BOTH FANS WITH REAR HITCH: KIT #7923 or 9070 6000 Series Tow Behind 7000 Series Tow Behind L9000 Series Tow Between

WARNING: Support fan housing from below with a jack or above with hoist to avoid injury and so no extra stress is put on the hydraulic hose connections

|       | being installed on. For models with external check valves, the connections must be made on the tractor side of the hydraulic circuit as shown below. | PART KIT #   | Varies     |

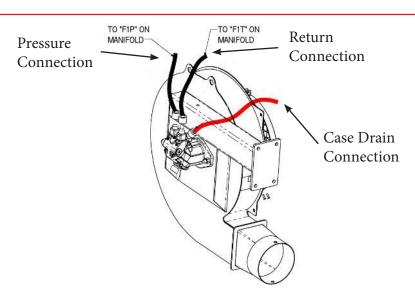

### **Installation with External Check Valve:**

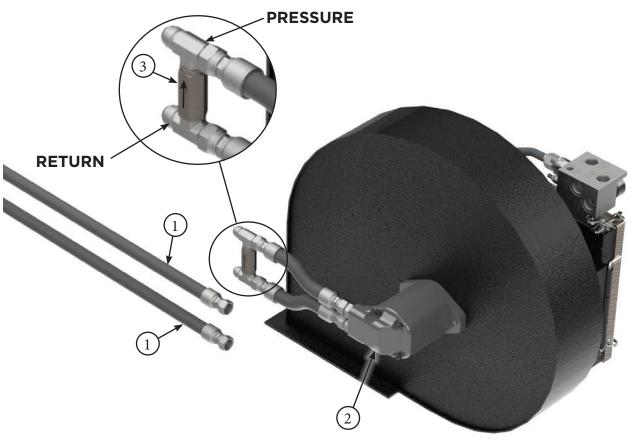

#### **Installation with Internal Check Valve:**

Note: The illustrations on the following pages will show the external check valve. If using the internal check valve, plumb directly to the fan motor.

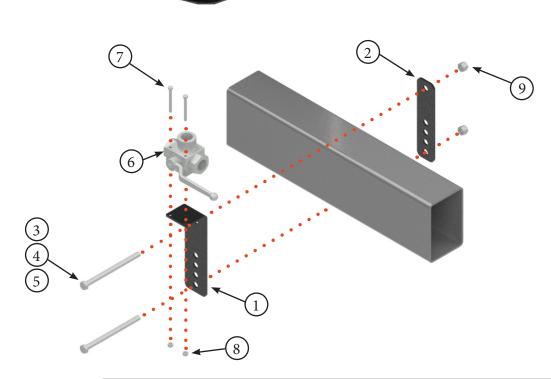

| Title | Airguard Blockage Prevention System Upgrade Instructions   | RELEASE DATE | 2024-03-28 |
|-------|--|--------------|------------|
| STEP  | 14. Remove factory hoses (Item 1) from side of fan motor (Item 2). Remove the hoses  | REV #        | 2.0        |
|       | (Item 1) on the tractor side of the external check valve, as shown below. Identify which hose is the pressure side of the circuit. The external check valve will have a directional arrow that always points to the pressure side. If you do not have an external check valve you will attach directly to the fan motor. | PART KIT #   | Varies     |

| STEP  | 24. Complete the hydraulic installation by ensuring that all connections made in Step   | REV #        | 2.0        |
|       | 15 to 23 are tightened. Position/Routing of hydraulic hoses may vary to suit each specific machine installation. Zip tie hoses to reduce wear and ensure tidy installation. | PART KIT #   | Varies     |

Ensure to Tighten all Hydraulic Connections

DO NOT ADJUST VALVES

## WARNING:

- Check for contaminants in oil. Dirty oil makes for plugged valves and can cause issues with over pressurizing the radiator core.
- Start tractor and warm oil prior to starting up fan. This should be done anytime the fan circuit is started up.
- Engage fan hydraulics at low flow rate and low fan RPM and slowly increase.
- Bleed hydraulic lines of air for stable oil flow.
- Check pressures at radiator gauge. If pressure is higher than normal, steps must be taken to reduce return line pressure.
- Call Airguard if you have any questions. 1-604-744-0070

| Title | Airguard Blockage Prevention System Upgrade Instructions | RELEASE DATE | 2024-03-28 |

|       |  | PART KIT #   | Varies     |

# ---- WARNING -----

## Start up procedure is critical to reduce pressure spikes.

#### START UP PROCEDURE:

After you have installed the Airguard Blockage Prevention System it's critical that you start the Aircart fans very slowly. You're introducing an air pocket that must be moved slowly to the tractor while you prime the hydraulic lines with oil. This process is a good way to make sure your fittings are sealed and secure.

- 1. Get your oil warmed to 80-100 deg F. If your oil is cold, the viscosity is very high and it will not move through the internal components easily. By warming the oil first, everything will operate as it should.
- 2. Initiate your fans with 500 Fan RPM at 25% oil flow (or 10% of your max fan speed). If everything looks good, the pressure is just starting to register on the Airguard pressure gauge. If all your fittings are holding their seal, continue to the next step. If your fan is NOT moving, that's okay. The oil is circulating.

  Operate this way for 5 minutes.

NOTE: If there is a pressure spike at this low oil flow rate, there is potential for an air lock. Disconnect the end fitting on the Return Line at the SCV and drain off some oil to release the pressure. Reconnect the end fitting and repeat Step 2.

- 3. Run 1000 Fan RPM at 45% oil flow (or 35% of your max fan speed). Operate for 5 seconds.
- 4. Run 2000 Fan RPM at 65% oil flow (or 75% of your max fan speed). Operate for 5 seconds.
- 5. Run 3500 Fan RPM at 85% oil flow (or 100% of your max fan speed). Operate for 3-5 minutes.
- 6. Take time to ensure that your conveyor or auger is working properly in conjunction with your Airguard kit. Turn your fan RPM down to 50% oil flow and engage the conveyor/auger. If everything is operating as it should, you have successfully installed your Airguard Blockage Prevention System kit. If there are any questions or concerns about the operations, call your AIRGUARD Sales Representative using contact information found at <a href="https://www.airguardproducts.com/contact">www.airguardproducts.com/contact</a> or visit us at <a href="https://www.airguardproducts.com/productsupport">www.airguardproducts.com/productsupport</a>. For troubleshooting and preventative maintenance, see pages 37-38.

Now you're ready to operate! Follow the same warm up procedure you do every day and go seed. We highly recommend you follow these steps at the beginning of each future season, to ensure the continuation of successful operations. After the freeze and thaw of winter and spring seasons we want to eliminate any air pockets or leaks that could be caused by the settling of the oil in the hydraulic system.

#### PREVENTATIVE MAINTENANCE

- 1. Ensure that the startup procedure on page 26 is performed every morning before seeding begins.
- 2. Take extra precautions when seeding in cold weather.
- 3. It is recommended that a bypass valve is purchased to allow-for quicker startup.

## **TROUBLESHOOTING**

| Trouble  | Probable Cause                                  | Remedy   |
|--|---|--|
| Fluctuating pressures on pressure gauges and strange noises coming from fan motor. | High return line pressure                       | The logic cartridge on the BP System is set to 750psi. Any value close to or above that will cause fluctuations and issues with fan speed, which is acting as intended. Reduce return line pressure to fix this problem. |
|  | Faulty quick disconnect couplers                | Replace quick disconnect couplers, inspect ball valve to ensure proper working order   |
|  | Restriction in return line due to small fitting | Replace fitting with a larger one  |
|  | Logic cartridge is contaminated                 | Clean or replace the logic cartridge as needed   |
| Fan won't run  | High return line pressure                       | The logic cartridge on the BP System is set to 750psi. Any value close to or above that will cause fluctuations and issues with fan speed. Reduce return line pressure to fix this problem.                              |
|  | Quick couplers are disconnected                 | Ensure that quick couplers are connected properly  |
|  | Logic cartridge is contaminated                 | Clean or replace the logic cartridge as needed   |
|  | Logic cartridge is faulty                       | Replace the logic cartridge  |
|  | Hoses are hooked up incorrectly                 | Consult owner's manual to see proper installation of hoses   |

#### FREQUENTLY ASKED QUESTIONS

Q: Why can't I operate my Blockage Prevention System without warming up my tractor first?

A: Tractor motors and seeding equipment are built to withstand fast startups; an aluminum radiator is not. On a cold day at 10% oil flow, your return pressure could be at 500psi on our Blockage Prevention System. If you were to do a fast startup in cold conditions, you could have a radiator fail. Pressures could dramatically spike beyond the capacity of our 2400psi rated aluminum core.

**Q:** Will the Blockage Prevention System cause dramatic pressure drops in my oil flow?

**A:** While the BPS will cause a slight pressure drop (approximately 400 RPM or less), the drop in oil flow is negated because of the warm air being transferred from the oil into the airstream. This allows the internal product to flow more efficiently. The reason for the slight pressure drop is that the oil has to pass through the orifices of the radiator, which are smaller than the hoses used prior to the installation of the Blockage Prevention System.

Q: Does the Blockage Prevention System actually work?

A: We can honestly say that it does. The hotter the oil is in the hydraulic lines, the more heat the Blockage Prevention System can extract out of that oil. Since the mechanism is mounted on the face of the fan housing, the fan is pulling air through the fins of the radiator while the air cart is pressurizing up to operate. The hot oil, running through the radiator, acts like a furnace and changes the air temperature on the inside face of the radiator. That air is then pulled into the air cart stream and is pushed out towards the openers, where the seed is placed into the furrow. Warmer air holds more moisture. Humidity will stay in a vapor state when it is drawn in and will be less likely to turn into a liquid while the air and all the hoses and internal components are physically warmer. This allows the product to flow through with less resistanc eand minimizes buildup of dusty fertilizer internally. Seed and fertilizer will be delivered to the discharge outlets without problems.

**Q:** What is the purpose of the new bypass valve?

**A:** The new bypass valve upgrade kit allows you to heat up your oil before engaging your Blockage Prevention System. You can also choose whether or not to use your BPS in the heat of the day.

Q: What pressure should the pressure gauge read on the Blockage Prevention System?

**A:** 300-600psi is an acceptable pressure range when operating. The gauge reads the pressure of the oil going through the radiator, on the return side of the fan motor.

**Q:** Do I need to reset the relief valves on the V2 Blockage Prevention System?

A: No you do not. The valves are preset to 750psi and 850psi. If they do get changed or altered, please contact Airguard in order to have them reset.
